No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                      1733

                This sequence represents novel infection-specific protein IncA of Chlamydda psittaci strain GPIC. IncA is found in the inclusion membrane of infected cells. It is associated primarily with the vegetative reticulate body form of Chlamydia rather than with the refractile elementary body form. The invention includes: a vaccine directed against the reticulate body form of Chlamydia comprising 1 or more infection-specific proteins (see AAX32170-78), including neathods for detection of infection-specific antibodies or antigens in a biological specime, and a method of using therapeutic agents specifically directed against infection-specific peptides, or the genes that code for such peptides, to treat chlamydial infection.

                                                                                                                                          AAY34584-Y35879 represent the proteins encoded by all the open reading frames in the complete genome (see AAX91990) of Chlamydia pneumoniae. C. pneumoniae causes respiratory disease such as pneumonia and disease, sand is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584.75859) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 266 LREEQVRFLEKRKQELEEACSTLSHSIATLQESTTLLKDSTTNLHAVESRLIGVMVQDGA 325

Novel bacterial infection specific proteins for treating and diagnosing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents novel infection-specific protein Inch of Chlamydia trachomatis LGV-434 (serotype L2). Inch is found in the wich the membrane of infected cells. It is associated primarily with the vegetative reticulate body form of Chlamydia rather than vaccine directed seanentary body form. The invention includes: a comprising or more infection specific proteins (see AAY32170-78), a vaccine, methods for detection of infection specific antibodies or antigens in a biological specimen; and a method of using such the verget of the vegetal specific antibodies the retrieval or method of using such the vegetal specifically directed against infection specific antibodies therefore the vegetal specific and vegetal veget
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            92 SVISTPSLILMLAIMLVSFVIVITAIRDGTPSQVVR----HMKQQIQQFGEENTRLHTAV 147

The present invention describes primer sets for synthesising 5602

cull-length cDNAs defined in the specification. Where a primer set

comprises: (a) an oligordT primer and an oligonucleotide complementary

cull of the complementary strand of a polynucleotide which comprises one of

coligonucleotide comprisions at least 15 nucleotides in the specification, where the

coligonucleotide comprising a sequence complementary to the

complementary strand of a polynucleotide which comprises a 5'-end

complementary strand of a polynucleotide which comprises a 5'-end

complementary strand of a polynucleotide which comprises a 5'-end

conjouncleotide which comprises a 1'-end sequence. Where the

coligonucleotide comprises at least 15 nucleotides and the combination of

the 5'-end sequence/1'-end sequence is selected from those defined in

in gene therapy. The primers are useful for synthesiating polynucleotides,

coligonucleotide comprises a the set is calcuted from those defined in

coligonucleotide comprises a the set is selected from those defined in

coligonucleotide comprises a primers are also useful for the

coligonucleotide comprises a primers are also useful for the

coligonucleotide comprises and the primers are also useful for the

coliforularly full-length cDNAs. The primers are also useful for the

collection and/or diagnosis of the abnormality of the proteins encoded by

collection and/or diagnosis of the abnormality of the proteins encoded by

collection and and primers are useful for synthesistal and

collection and/or diagnosis of the abnormality of the proteins encoded by

collection and and protein and collection and also and and also and and also and and also and als

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher entraryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57373-ABB72072).

(ABB57373-ABB72072).

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ---SEQINQLKQL 167

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               įs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (ABB57737-ABB12072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and in elucidating cell signalling and in signation in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176 ABL30511), expressed DNA sequences (ABL01840 ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1057 iknlqeevtkaktenlelstgtqttikdlqerleitnaelqhkekmasedaqkiadlktl 1116

AX AAC7446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activitites such as: cytostatic; hepatotropic; vulnerary; cosquences have activitities such as: cytostatic; hepatotropic; vulnerary; antipsorialic; antiparkinsonian; nootropic; neuroprotective; osteopathic; antiparkinsonian; nootropic; neuroprotective; cosquences; mannosuppressant; munosuppressant; antidiabetic; hypotensive; dermatological; immunosuppressant; antidiabetic; hypotensive; dermatological; immunosuppressive; antithyroid; and antibarcerial; antivingal; antirheumatic; the presence of or predisposition to, or preventing or treating continued associated with an ORFX-associated disorder. The presence of or predisposition to, or preventing or treating cucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, cucleic acids and nucleic acids may be used to treat cancers, cortors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthitis, cortain the second of the proteins and nucleic acids may be used to treat cancers, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus cortains of fungal infection, malaria, autolimune disorders, asthma, allergies, aplastic ansemia, burns, wounds, bone and cartilage damage, coagulation; to inhibit thrombosis; and as contraceptive.

AAU03501-AAU03557 represent novel human protein kinases #1-57. The novel protein kinases have been identified as members of the tyrosine or serine/threonine kinase (PTK and STK) families. The polynucleotides or serine/threonine kinase (PTK and STK) families. The polynucleotides corrected in the prevention, diagnosis and treatment of diseases associated with inappropriate kinase expression. For example, they may be used to treat inappropriate kinase expression. For example, they may be used to treat cancers (especially cancers of haematopoletic origin), cardiovascular cancers (especially cancers of haematopoletic origin), cardiovascular cancers (e.g. atherosclerosis), metabolic disorders (e.g. diabetes), commune related diseases (e.g. rheumatoid arthritis), neurological disorders (e.g. schizophrenia), neurodegenerative disorders (e.g. asthma), infectious cancers (e.g. HIV) and reproductive disorders (e.g. infertility).

Compared therapy and as DNA probes in diagnostic assays.

Compared therapy and as DNA probes in diagnostic assays.

Compared therapy and as DNA probes in diagnostic assays.

Compared therapy and as DNA probes and in assays to identify medulators of protein kinase expression and activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        8

AAC7446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORRX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; cartipsoriatic; antiparkinsonian; noticopic; neuroprotective; costeopathic; anticonvulsant; antiarthritic; immunosuppressant; costeopathic; anticonvulsant; antiarthritic; immunosuppressant; contidiabetic; hypotensive; dermatological; immunosuppressive; antiinflammatory; antibacterial; antiviral; antifungal; antirhemmatic; the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The proteins and nucleic acids may be used for determining pathological conditions associated with an ORFX-associated disorder. The vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, graft vs host disease, cardiovascular disease, diabetes mellitus, cythematosus, severe combined immunodeficiency (SCID), AIDS, viral, allegies, aplastic anaemia, burns, wounds, bone and cartilage damage, coagulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          8;

This sequence represents the human kinesin, KSP-S553, which may be used in the method of the invention to screen for drug candidates and bloactive agents. The method comprises combining the candidate of the candidate or the bloactivity of KSP, and determining the effect in the bloactivity of KSP may be determined by assays for determining changes in the mitotic spindle, particularly inhibition of mitosis, to determine the effect of candidate agents on apoptosis and necrosis. The method of the invention is useful for screening for drug assays The method of the invention is useful for screening for drug candidates (especially bloactive agents and proteins) which effect the bloactivity of KSP, and/or expression of KSP, where the cells are

This sequence represents the human kinesin, KSP, which may be used in the method of the invention to screen for drug candidates and bloactive agents. The method comprises combining the candidate and a cell expressing recombinant KSP, and determining the effect of the candidate on the bloactivity of recombinant KSP. Changes in the bloactivity of KSP may be determined by assays for determining and ATP hydrolysis. It may also be determined by performing assays and ATP hydrolysis. It may also be determined by performing assays to determine the effect of candidate agents on apoptosis and necrosis. The method of the invention is useful for screening for drug candidates. The method of the invention is useful for screening for drug candidates (especially bloactive agents and proteins) which effect the bloactivity of KSP binding to KSP and/or expression of KSP, where the cells are

BimC is a kinesin related protein, which is essential for fungal viability. Is a kinesin related protein, which is essential for fungal viability. The specification describes a method of identifying modulators of bimc. The method comprises adding a test agent to a mixture comprising bimc. Or protein that directly or indirectly produces ADP or phosphate, subjecting the mixture to an enzymatic reaction that uses the ADP or phosphate. Or and determining the enzymatic activity in presence and absence of test compound. A change in the activity level between the presence of test of the candidate agent indicates a modulator of the target protein of the method is useful for identifying a modulator, e.g. cuntifungal agents, of bimc. The modulators can be used, for example, to inhibit the growth or spread of fungi, mould, fruit flies, etc.. The inhibit the growth or spread of fungi, mould, fruit flies, etc.. The condulators can be used for preventing and treating infections caused computations. Ascomycetes, plasmodiophoromycetes, open comycetes, Zygomycetes, and Basidlomycetes.

Putative sensory transduction histidine kinase and response regulator #3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to the genomic sequence of Pyrococcus abyssi (see AAF86431 and AAH41223-7) and P. abyssi proteins. P. abyssi is a hyperthermophilic archaeon, which is isolated from deep-sea hydrothermal vents. The present sequence is one such P. abyssi protein. The proteins of the present invention have various potential industrial uses, since the proteins are stable at very high temperatures, some up to

Expression and DNA sequence analysis of a human embryonic skeletal

muscle myosin heavy chain gene.";

Nucleic Acids Res. 17:6167-6179(1989).

- I- FUNCTION: MUSCLE CONTRACTION: A HEXAMERIC PROTEIN THAT CONSISTS OF 2

HEAVY CHAIN SUBUNITS (MIC). 2 ALKALI LIGHT CHAIN SUBUNITS (MIC).

- SUBCELLULAR LOCATION: Thick filaments of the myofibrils.

- DEVELOPMENTAL STAGE: ABUNDANTLY PRESENT IN FETAL SKELETAL MUSCLE

- NUCLE OF THE STAGE: ABUNDANTLY PRESENT IN FETAL SKELETAL MUSCLE

- NUCLE OF THE STAGE: ABUNDANTLY PRESENT IN HEART AND ADULT SKELETAL

-1- PTM: TWO CYSTEINE RESIDUES IN THE S1 DOMAIN ARE SELECTIVELY ALKYLAPED AND ARE REDOITED FOR WYOSIN ATPASE ACTIVITY.
-1- MISCELLANEOUS: EACH MYOSIN HEAVY CHAIN CAN BE SPLIT INTO 1 LIGHT BEROMYOSIN (LAM) AND 1 HEAVY MEROMYOSIN (HAM). IT CAN LATER BE SPLIT FURTHER INTO 2 GLOBULAR SUBFRAGMENTS (S1) AND 1 ROD-SHAPED SUBFRAGMENT (S2).
-1- SIMILARITY: CONTAINS 1 MYOSIN-LIKE GLOBULAR HEAD DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      "Identification of three developmentally controlled isoforms of human
                                                                                                                                                                                                                                                                                                                           Euteleostom1;

BIOL. 190:291-317(1986).

AND. BIOL. 190:291-317(1986).

C. I- FUNCTION. MUSCLE CONTRACTION.

C. I- SUBGNIT: MUSCLE MYOSIN IS A HEXAMERIC PROTEIN THAT CONSISTS OF 2. HEAVY CHAIN SUBUNITS (MLC.).

AND 2 REGULATORY LIGHT CHAIN SUBUNITS (MLC.2).

C. I- SUBCELLUIAR LOCATION: THICK filaments of the myofibrils.

C. CYCLES OF A 28-RESIDUE REPART PATLES OF SEPTITIVE, SHOWING

C. CYCLES OF A 28-RESIDUES REPART PATLES COLLED COLLES.

CHARACTERISTIC FOR ALPHA-HELICAL COLLED COLLS.

C. PTM: TWO CYSTEINE RESIDUES IN THE SIDOMAIN ARE SELECTIVELY

ALKULTATED AND ARE REQUIRED FOR MYOSIN ATPASE ACTIVITY.

C. HIGGELANEOUS: EACH MYOSIN HEAVY CHAIN CAN BE SPLIT INTO 1 LIGHT

MEROMYOSIN (LAM) AND 1 HEAVY MEROMYCSIN (HMM). IT CAN LATER BE

MEROMYOSIN (LAM) AND 1 HEAVY MEROMYCSIN (HMM). IN CONTAINS 1 WOSIN-LIKE GLOBULAR HEAD DOMAIN.

C. SIMILARITY: CONTAINS 1 1Q DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                coil; Thick filament; Actin-binding;

SUBUNIT: MUSCLE MYOSIN IS A HEXAMERIC PROTEIN THAT CONSISTS OF 2 HEAVY CHAIN SUBUNITS (MHC), 2 ALKALI LIGHT CHAIN SUBUNITS (MLC) AND 2 REGULATORY LIGHT CHAIN SUBUNITS (MLC-1).

SUBCELLUIAR LOCATION: Thick filaments of the myofibrils. SHOWING DOWAIN: THE RODLIKE TAIL SEQUENCE IS HIGHLY REPETITIVE, SHOWING DOWAIN: THE ROBLIKE TAIL SEQUENCE IS HIGHLY REPETITIVE, SHOWING CHARACTERISTIC FOR ALPHA-HELICAL COLLED COILS.

PHY: TWO CYSTEINE RESIDUES IN THE SI DOMAIN ARE SELECTIVELY ALKYLAPED AND ARE REQUIRED FOR MYOSIN ATBASE ACTIVITY.

ALKYLAPED AND ARE REQUIRED FOR MYOSIN AREAS ACTIVITY.

MISCELLANGOUS. EACH MYOSIN HEAVY CHAIN CAN BE SPLIT INTO 1 LIGHT MEROMYOSIN (LMM). AND 1 HEAVY MEROMYOSIN (HMM). IT CAN LATER BE SELLY PROPERTIES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Coiled coil; Thick filament; Actin-binding;

ASSOCIATED WITH INTRACELLULAR MEMBRARES. PROBABLY PRESENT ON VESICLES OPERATIONAL BETWEEN THE ER AND THE GOLGI COMPLEX.

DOMAIN: THE RODLIKE TAIL SEQUENCE IS HIGHLY REPETITIVE, COMPOSED OF AN HEPTAPEPTIDE REPEAT PATTERN CHARACTERISTIC OF ALPHA-HELICAL COILLS. MAY FORM FILAMENTOUS STRUCTURES IN THE CELL.

SIMILARITY: BELONGS TO THE VDP/USO1/YBL047C FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Bal Y., Symington L.S.;

HEAVY CHAIN SUBUNITS (MHC), 2 ALKALI LIGHT CHAIN SUBUNITS (MLC)
AND 2 REGULATORY LIGHT CHAIN SUBUNITS (MLC-2).
SUBCELLLUALE LOCATION: Thick filaments of the myofibrils.
DOMAIN: THE RODLIKE TAIL SEQUENCE IS HIGHLY REPETITIVE, SHOWING CYCLES OF A 28-RESIDUE REPEAT PATTERN COMPOSED OF 4 HEPTAPEFILDES, PTM: TWO CYSTEINER RESIDUES IN THE SI DOMAIN ARE SELECTIVELY ALKYLATED AND ARE REQUIRED FOR MYOSIN ATPASE ACTIVITY.
MISCELLANBOUS: EACH MYOSIN HEAVY CHAIN CAN BE SPLIT INTO 1 LIGHT SPLIT EURTHER INTO 2 GLOBULAR SUBFRAGMENTS (S1) AND 1 ROD-SHAPED
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1161 TSAQIELNKKREABFQKMRRDLEESTLQHEATAAALRKKHADSVABLGKQIDSLQRVKQK 1220

Patent No. 6287790
GENERAL INFORMATION:
APPLICANT: Lelievre, Sophie
APPLICANT: Lelievre, Sophie
APPLICANT: Bissell, Mina
TITLE OF INVENTION: UTILIZATION OF NUCLEAR STRUCTURAL PROTEINS FOR TARGETED
TITLE OF INVENTION: THERRHAND DETECTION OF PROLIFERATIVE AND
TITLE OF INVENTION: DIFFERENTIATION DISORDERS
FILE REFERENCE: IB-1454 - Sequence Submittal
Patent No. 6287790
